Introduction. Bison is a general-purpose parser generator that converts an annotated context-free grammar into a deterministic LR or generalized LR (GLR) parser employing LALR(1), IELR(1) or canonical LR(1) parser tables. Once you are proficient with Bison, you can use it to develop a wide range of language parsers, from those used in simple desk calculators to complex programming languages.

Bison 3.8.1 - GNU

In this method, when a parser encounters an error, it performs the necessary correction on the remaining input so that the rest of the input statement allows the parser to parse ahead. The correction can be deletion of extra semicolons, replacing the comma with semicolons, or inserting a missing semicolon.

2. <content-list> Values and Functions The <content-list> value is used in content to fill an element with one or more anonymous inline boxes, including images, strings, the values of counters, and the text value of elements. In this section we enumerate the possibilities. 2.1. String <string> Represents an anonymous inline box filled with the specified text.

CSS Generated Content Module Level 3

What (1)-(3) show, if true, is that grammar G can't be learned from the pld by a learner using a 'Popperian' learning strategy, that is, a strategy of 'bold conjecture' and refutation. What (4) concludes, however, is that G is unlearnable, period, from the pld — a move that several authors, particularly connectionists, have objected to.
