Synchros work by the change in force to the teeth. When the synchro is loaded and trying to synchronize the assembly, the pic above is how the teeth should line up and the arrows show the direction of the force being applied. Once the part is synchronized, the force changes and you then get a direct 'UP' and 'DOWN' force to the teeth like the ...

The late model MGB with 4-synchro gearbox uses steel synchro rings, which last a LOT longer before wearing out. This is particularly pertinent for 2nd gear, which gets more use and abuse than the others. There is an "improved" steel synchro ring available for the earlier gearboxes, but it requires also changing the mating 2nd gear.

Synchros work by speeding up or slowing down the input shaft and clutch disk by acting like a brake. If the clutch is dragging, the synchro friction surface is trying to speed up and slow down the engine's mass, which is impossible. The synchro will burn up, fail and the transmission has just been ruined.
