Solution using Depth First Search or DFS. Approach: Depth First Traversal can be used to detect a cycle in a Graph. DFS for a connected graph produces a tree. There is a cycle in a graph only if there is a back edge present in the graph. A back edge is an edge that is from a node to itself (self-loop) or one of its ancestors in the tree produced by DFS.

Algorithm to check if a graph is Bipartite: One approach is to check whether the graph is 2-colorable or not using backtracking algorithm m coloring problem. Following is a simple algorithm to find out whether a given graph is Birpartite or not using Breadth First Search (BFS). 1. Assign RED color to the source vertex (putting into set U). 2.

In mathematics, the graph of a function is the set of ordered pairs (,), where () =.In the common case where and () are real numbers, these pairs are Cartesian coordinates of points in two-

dimensional space and thus form a subset of this plane.. In the case of functions of two variables, that is functions whose domain consists of pairs (x, y), the graph usually refers to the set of ordered ...

In mathematics, graph theory is the study of graphs, which are mathematical structures used to model pairwise relations between objects.A graph in this context is made up of vertices (also called nodes or points) which are connected by edges (also called links or lines).A distinction is made between undirected graphs, where edges link two vertices symmetrically, and directed graphs, where ...

We also saw a graph in the section where we introduced intercepts where an intercept just touched the axis without actually crossing it. Finding intercepts is a fairly simple process. To find the y-intercept of a function $y = f\left(x \right)$ all we need to do is set $x = 0$ and evaluate to find the y coordinate.

The y-intercept of any graph is a point on the y-axis and therefore has x-coordinate 0. We can use this fact to find the y-intercepts by simply plugging 0 for x in the original equation and simplifying. Notice that if we plug in 0 for x we get: $y = a(0)^2 + b(0) + c$ or $y = c$. So the y-intercept of any parabola is always at (0,c).

on supervised learning over graph-structured data. This includes a wide variety of kernel-based approaches, where feature vectors for graphs are derived from various graph kernels (see [32] and references therein). There are also a number of recent neural network approaches to supervised learning over graph structures [7, 10, 21, 31].
