Offshore Oil And Gas Process

The main function of the process plant on an offshore installation is to separate hydrocarbon products into liquid and gaseous phases and to remove any impurities that could hinder transportation, e.g. water. This process is called production , Offshore installations are either oil or gas producing

Offshore oil and gas producing process - VisualEngineerInfo

Offshore drilling is the process of extracting petroleum from reserves located beneath the Earth's oceans instead of reserves located on the mainland. Offshore oil rigs have developed greatly over the past years, and have become gigantic structures that house hundreds of people at a time. Some facilities sit on towers that go to depths of 1220 meters below the surface, larger than any ...

The emphasis is on oil production facilities – from the wellhead, to the delivery of a specification gas or crude oil product, to the refinery. In addition to the engineering aspects of oil production facilities, practical operating problems will also be covered, including emulsion treatment and sand handling.

Offshore Oil and Gas Processing - Worley Academy

Offshore oil production involves environmental risks, most notably oil spills from oil tankers or pipelines transporting oil from the platform to onshore facilities, and from leaks and accidents on the platform. Produced water is also generated, which is water brought to the surface along with the oil and gas; it is usually highly saline and may include dissolved or unseparated hydrocarbons.
